# Professional Issues II Unit 4: blackbox testing Lab preparation

Markus Roggenbach

# Test automation with JUnit

### Reminder of the different test activities

- 1. Design of a Test Suite (choosing test inputs & determining the expected results)
- 2. Execution of the Test Suite (obtaining the actual results)
- 3. Test evaluation (determining pass / fail for each test case, and for the Test Suite as a whole)
- 4. Test documentation (document execution and evaluation)

JUnit

### **JUnit**

JUnit is a simple framework to write repeatable tests, see <a href="http://junit.org/index.html">http://junit.org/index.html</a>

JUnit automatises test execution & test evaluation.

Cost: one needs to encode test suites into a special format.

# **Encoding of single test cases in JUnit**

### **Specification**

**Input:** integer

Output: string "Hugo" if i is 1, Erna otherwise.

Test-Suite:	Name	Input	Expected Output
	test1	1	"Hugo"
	test2	2	"Erna"

#### SUT:

public static String produceHugo(int i) {return "Hugo";}

# **Encoding of the Test-Suite in JUnit**

Test-Suite:	Name	Input	Expected Output
	test1	1	"Hugo"
	test2	2	"Erna"

### One possible encoding in JUnit:

```
@Test
public void test1ProduceHugo(){
    assertEquals("Hugo", Hugo.produceHugo(1));}

@Test
public void test2ProduceHugo() {
    assertEquals("Erna", Hugo.produceHugo(2));}
```

JUnit "infrastructure"

# JUnit "infrastructure"

Mark-up "@Test" stands for:

The following methods are tests.

# Method assertEquals:

- first parameter: expected output
- second parameter: call the SUT with the input value(s) as actual parameters

→ Tool-Demo

JUnit in Eclipse 8

# JUnit in Eclipse

File Structure: SUT file and test case file on the same level.

```
    ▼ ∰ (default package)
    ▶ ☑ MyTestCases.java
    ▶ ☑ ToBeTested.java
```

Test Execution via run-button also yields test evaluation:

```
▼ MyTestCases [Runner: JUnit 4] (0.001 s)
test1ProduceNumber (0.001 s)
test2ProduceNumber (0.001 s)
```

There is information about the error:

```
Failure Trace

Journal Java.lang.AssertionError: expected: <6> but was: <7>
at MyTestCases.test2ProduceNumber(MyTestCases.java:13)
```

### Further asserts of JUnit include

```
assertFalse(boolean condition)
          Asserts that a condition is false.
assertNotNull(Object object)
          Asserts that an object isn't null.
assertNotSame(Object unexpected, Object actual)
          Asserts that two objects do not refer to the same object.
assertNull(Object object)
          Asserts that an object is null.
assertSame(Object expected, Object actual)
          Asserts that two objects refer to the same object.
assertTrue(boolean condition)
          Asserts that a condition is true.
```

Kent Beck: JUnit Pocket Guide. O'Reilly, 2004.

Specifically it [this book] will appeal to programmers and developers of any level that use JUnit to do their unit testing in test-driven development under agile methodologies such as Extreme Programming (XP).
